- --1. (Four Times Amended) A process for the production of a buckling resistant stove-finished structural component from a cold strip which comprises ageing-sensitive steel with a high bake-hardening potential, comprises the steps of:
- converting the cold strip by temper rolling to a yield point elongation-free state in which the condition  $R_{eh}$   $R_{el}$  < 2 N/mm<sup>2</sup> is met,
- storing the cold strip at storage temperature below room temperature for a storage period whose length is at most equal-to-the length of the period at whose end-the value of critical ageing is reached which results in dependence on the particular storage temperature,
  - cold working the cold strip to give a structural component, and
  - stove-finishing the structural component.
- 3. (Thrice Amended) A process for the production of a buckling-resistant stove-finished structural component from a cold strip which comprises ageing-sensitive steel with, a high bake-hardening potential, comprises the steps of:
  - storing the cold strip undressed for a storage period at room temperature,
- converting the cold strip by temper rolling to a state in which the condition  $R_{\text{ch}}$   $R_{\text{cl}} < 2 \text{ N/mm}^2$  is met,
  - cold working the temper rolled cold strip to give a structural component, and
  - stove-finishing the structural component.--
